## EMPLOYMENT

---

<b>Columbia Business School</b>	New York, NY
Assistant Professor of Business, Accounting Division	2023 – Present

---

## EDUCATION

---

<b>University of Chicago Booth School of Business</b>	Chicago, IL
PhD, Dissertation Area: Accounting	2023
MBA	2023

<b>University of Chicago</b>	Chicago, IL
BA Economics, BA Statistics	2017

---

## RESEARCH

---

### Interests

My research examines the impact of frictions in information processing, investor decision making, and financial statement analysis on asset prices and firm investment. Some examples include examining the frictions in processing industry classifications, constructing investment portfolios when facing career concerns, and analyzing loan loss provisions on bank financial statements.

### Working Papers

“Processing Industry Classification” [Job Market Paper]

- *Abstract:* External users of financial reporting often rely on industry classification providers to reduce processing costs. I study the economic consequences of capital market participants relying on the Global Industrial Classification Standard (GICS). I find that firms with higher quality classifications exhibit stronger liquidity, a lower cost of capital, and higher investment. When exploiting staggered GICS reclassifications as a shock to classification quality, I find relative improvements for firms with lower pre-treatment classification quality. The results are stronger for conglomerate firms that are more difficult to process and for firms that lack sell-side analyst coverage. Finally, I find increased investment for spillover firms after reclassified firms join their GICS industry group. Taken together, I provide evidence that industry classification providers generate capital market, real, and spillover effects through their information processing.

“Career Concerns and Time Arbitrage”

- *Abstract:* Fund managers face career concerns that can distort decision making. Managers may make short-term investment decisions because of the possibility of asset redemption from their investor base, which can create mispricing opportunities for longer-term fund managers who do not face such frictions. Value investors have speculated about these opportunities, but prior literature has yet to study this possibility systematically. I fill this gap by examining whether this mispricing opportunity, known as Time Arbitrage, exists. I identify longer-term managers using active managers' share-weighted holding periods (Duration). Consistent with long-term managers exploiting Time Arbitrage, I find that firms with long Duration generate significantly greater returns than those with short Duration. The predictive power of Duration lasts for more than 5 years after the fund holdings are reported, in line with the mispricing being long-term in nature. The mispricing premium is larger among small, volatile, and poorly performing firms that are harder for career concerned managers to hold. Taken together, this paper provides the first systematic evidence of the Time Arbitrage strategy.

**Works in Progress**

Labor Expense Disaggregation on the Income Statement (with Yue Chen, Nan Li, and Shivaram Rajgopal)

Impact of Profitability Shocks on the Value Premium (with Doron Nissim and MJ Song)

Index Fund Discretion by the S&P Index Committee (with Frank Zhang and Shivaram Rajgopal)

Diagnostic Expectations and Loan-Loss Provisions (with Yao Lu and Valeri Nikolaev)
